Why interval unions?

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ Let $f : \mathbf{R} \rightarrow \mathbf{R}$ be a differentiable function and \mathbf{x}_0 an interval where we are looking for x^* such that $f(x^*) = 0$.
- ▶ Interval Newton method encloses all roots of f .

$$\mathbf{x}^{(k+1)} := N(\mathbf{x}^k) \cap \mathbf{x}^k, \quad N(\mathbf{x}) = \check{\mathbf{x}} - \frac{f(\check{\mathbf{x}})}{\mathbf{f}'(\mathbf{x})}, \quad k = 0, 1, 2, \dots$$

- ▶ What if $0 \in \mathbf{f}'(\mathbf{x})$? Apply the extended division!

Why interval unions?

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

Let $\mathbf{a} = [\underline{a}, \bar{a}]$ and $\mathbf{b} = [\underline{b}, \bar{b}]$. The extended division is given by

$$\mathbf{a}/\mathbf{b} := \begin{cases} \mathbf{a} \cdot [1/\bar{b}, 1/\underline{b}] & \text{if } 0 \notin \mathbf{b}, \\ (-\infty, +\infty) & \text{if } 0 \in \mathbf{a} \wedge 0 \in \mathbf{b}, \\ [\bar{a}/\underline{b}, +\infty) & \text{if } \bar{a} < 0 \wedge \underline{b} < \bar{b} = 0, \\ (-\infty, \bar{a}/\bar{b}] \cup [\bar{a}/\underline{b}, +\infty) & \text{if } \bar{a} < 0 \wedge \underline{b} < 0 < \bar{b}, * \\ (-\infty, \bar{a}/\bar{b}] & \text{if } \bar{a} < 0 \wedge 0 = \underline{b} < \bar{b}, \\ (-\infty, \underline{a}/\underline{b}] & \text{if } 0 < \underline{a} \wedge \underline{b} < \bar{b} = 0, \\ (-\infty, \underline{a}/\bar{b}] \cup [\underline{a}/\bar{b}, +\infty) & \text{if } 0 < \underline{a} \wedge \underline{b} < 0 < \bar{b}, * \\ [\underline{a}/\bar{b}, +\infty) & \text{if } 0 < \underline{a} \wedge 0 = \underline{b} < \bar{b}, \\ \emptyset & \text{if } 0 \notin \mathbf{a} \wedge \underline{b} = \bar{b} = 0. \end{cases}$$

Why interval unions?

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ Division by intervals containing zero is problematic. For example, if $\mathbf{a} = [2, 3]$ and $\mathbf{b} = [-1, 1]$ then

$$\mathbf{x} = \frac{[2, 3]}{[-1, 1]} = (-\infty, -2] \cup [2, \infty).$$

- ▶ \mathbf{x} is not an interval.
- ▶ Extended division requires special treatment from a computational point of view.

What is an interval union?

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ An interval union is a finite set of disjoint intervals:

$$\boldsymbol{u} = (\underline{u}_1, \dots, \underline{u}_k) \quad \text{with} \quad \underline{u}_i \in \overline{\mathbb{IR}} \quad \forall i = 1, \dots, k, \\ \overline{u}_i < \underline{u}_{i+1} \quad \forall i = 1, \dots, k-1.$$

where

$$\overline{\mathbb{IR}} := \{[\underline{a}, \overline{a}] \cap \mathbb{R} \mid \underline{a} \leq \overline{a}, \underline{a}, \overline{a} \in \mathbb{R} \cup \{-\infty, \infty\}\}.$$

For example:

$$\boldsymbol{u} = \{[-1, 0], [2, 3]\}$$

$$\boldsymbol{v} = \{(-\infty, -1], [1, \infty)\}$$

$$\boldsymbol{w} = \{[2, 2], [3, 3]\}$$

Interval union arithmetic

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation
Interval unions
Interval union
linear systems
Interval union
Newton
method

- ▶ Let $u = \{[-1, 1], [2, 3]\}$ and $v = \{[-3, -2], [5, 6]\}$

$$u + v = \{[-4, 1], [4, 9]\}$$

$$u - v = \{[-7, -2], [1, 6]\}$$

$$u * v = \{[-9, 6], [10, 18]\}.$$

$$v/u = \{(-\infty, -2], [-1.5, -0.6666], [1.6666, \infty)\}.$$

What holds

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ Magnitude: $|u| := \max(|\mathbf{u}_1|, \dots, |\mathbf{u}_k|) = \max(|\underline{\mathbf{u}}_1|, |\bar{\mathbf{u}}_k|)$,
- ▶ Mignitude: $\langle u \rangle := \min(\langle \mathbf{u}_1 \rangle, \dots, \langle \mathbf{u}_k \rangle)$,
- ▶ Max and Min: $\max(u) := \bar{\mathbf{u}}_k$, $\min(u) := \underline{\mathbf{u}}_1$,
- ▶ Inclusion isotonicity:

$$\mathbf{v}' \subseteq \mathbf{v}, \mathbf{u}' \subseteq \mathbf{u} \Rightarrow \mathbf{v}' \circ \mathbf{u}' \subseteq \mathbf{v} \circ \mathbf{u} \text{ for all } \{+, -, /, *\},$$

- ▶ Fundamental Theorem: If \mathbf{f} is inclusion isotonic and the interval union extension of $f : \mathbb{R}^n \rightarrow \mathbb{R}$ then $f_{rg}(\mathbf{u}) \subseteq \mathbf{f}(\mathbf{u})$.

What does not

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ Taylor expansion: Let $f : \mathbb{R}^n \rightarrow \mathbb{R}$ be a differentiable function defined in a box $\mathbf{x} \subset \mathbb{R}^n$. If $z \in \mathbf{x}$, \mathbf{f} is an interval extension of f and \mathbf{g} the interval extension of ∇f then

$$f(x) \in f(z) + \mathbf{g}(x)^T(x - z), \quad \forall x \in \mathbf{x}.$$

- ▶ Let $f(x) = x^2$ and $\mathbf{u} = \{[-3, 1], [1, 3]\}$. Take $x = -2 \in [-3, -1]$ and $z = 2 \in [1, 3]$. There is not $\xi \in \mathbf{u}$ such that

$$4 = 4 - 8\xi.$$

Interval union matrices and vectors

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

$$\mathcal{A} = \begin{pmatrix} \{[-5, -3], [4, 5]\} & \{[0.5, 1.0], [2, 3]\} \\ \{[0.5, 1.0], [2, 3]\} & \{[-3, -2], [2, 3]\} \end{pmatrix}$$

$$\boldsymbol{\delta} = (\{[-1, 1], [1.5, 2], [3, 4]\}, \{[-1, 0], [1, 3], [5, 7]\})^T$$

- ▶ Regularity, M -matrices and H -matrices are well defined.
- ▶ \mathcal{A} represents 16 interval matrices (with only 8 intervals) and $\boldsymbol{\delta}$ 9 boxes (6 intervals).

Interval union matrices and vectors

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation
Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ An interval union linear system is the family of equations

$$Ax = b \quad (A \in \mathcal{A}, b \in \mathcal{B}).$$

- ▶ The solution set is defined by

$$\Sigma(\mathcal{A}, \mathcal{B}) := \{x \in \mathbb{R}^n \mid Ax = b \text{ for some } A \in \mathcal{A}, b \in \mathcal{B}\}.$$

- ▶ Let $\mathcal{B}(\mathfrak{v}) := \mathfrak{v}_1 \otimes \mathfrak{v}_2 \otimes \dots \otimes \mathfrak{v}_n$, $\mathcal{A} \in \mathcal{U}^{n \times n}$ and $\mathcal{B} \in \mathcal{U}^n$.
Then

$$\bigcup_{\substack{\mathbf{A}_i \in \mathcal{B}(\mathcal{A}) \\ \mathbf{b}_j \in \mathcal{B}(\mathcal{B})}} \Sigma(\mathbf{A}_i, \mathbf{b}_j) \equiv \Sigma(\mathcal{A}, \mathcal{B}).$$

Interval union matrices and vectors

Interval unions
on rigorous
optimization

Tiago
Montanher,
Ferenc
Domes,
Hermann
Schichl,
Arnold
Neumaier

Motivation

Interval unions

Interval union
linear systems

Interval union
Newton
method

- ▶ Let S be a finite set of intervals, the **union creator** $\mathcal{U}(S)$ is the smallest u that satisfies $a \subseteq u$ for all $a \in S$.
- ▶ Finding $\mathcal{U}(\Sigma(\mathcal{A}, \beta))$ is NP –Hard.
- ▶ In general, we look for x such that

$$\mathcal{U}(\Sigma(\mathcal{A}, \beta)) \subseteq x.$$

- ▶ If \mathcal{A} is an M –matrix and β is degenerate then

$$\mathcal{U}(\Sigma(\mathcal{A}, \beta)) = \bigcup_{\substack{\mathbf{A}_i \in \mathcal{B}(\mathcal{A}) \\ \mathbf{b}_j \in \mathcal{B}(\beta)}} [\underline{\mathbf{A}}_i, \overline{\mathbf{A}}_i] \mathbf{b}_j.$$

An interval linear system
